IMPROVEMENT BLUEPRINT

v1.1 — Full Feature Expansion Roadmap

28	6	3
Total Ideas	Categories	Priority Tiers

Gamification	UX	Social	Tools	Monetization	Tech
--------------	----	--------	-------	--------------	------

A structured feature expansion roadmap for the Solo Leveling: 90 Days Android app. Each idea includes implementation notes, effort rating, and expected impact.

Developed by Sabari · com.example.lifereset · Android / Kotlin / Jetpack Compose

[GAMIFICATION]

G1 Rank System — E Class to S Class

Replace flat 'Level N' with Solo Leveling's actual rank ladder: $E \rightarrow D \rightarrow C \rightarrow B \rightarrow A \rightarrow S$. Each rank unlocks at a specific XP milestone and triggers a full-screen cinematic reveal animation. Massively more on-brand than generic level numbers, and gives users a long-term identity goal ("I'm B-Class, grinding for A") that a number alone never creates.

HOW: Map ranks to existing XP thresholds. Add a rank reveal Compose animation with lottie or custom canvas draw.

Easy

Impact: High

G2 Boss Battle Days (Day 7, 15, 30...)

Every 7th and 15th day triggers a special 'Gate Opened' event with a full-screen boss card, dramatic entry animation, and a harder quest set worth 3x XP. Missing a Boss Day in Hard Mode applies a double XP penalty. Creates anticipation, makes milestones feel earned, and gives users something to screenshot and share.

HOW: Check $\text{dayNumber} \% 7 == 0$ on launch. Load a special BossQuestSet from AppData. Gate animation via InfiniteTransition.

Medium

Impact: High

G3 Quest Difficulty Tiers (Normal / Hard / Legendary)

Tag each quest with a difficulty tier. Normal quests work as today. Hard quests give 1.5x XP but have a time window (must be done before 10 PM). Legendary quests give 3x XP but can only be attempted once per week. Adds strategy and replayability — users stop treating the quest list as a checkbox and start planning their day around it.

HOW: Add tier field to Quest model. Add time-window validation in `completeDayIfAllDone()`. Show tier badge on quest card.

Easy

Impact: Medium

G4 Forgiveness Token — Gate Pass System

Award 1 'Gate Pass' token every 10-day streak. Users can spend one token to prevent a missed-day streak reset — the app shows a 'Gate Pass Used' dialog instead of the penalty screen. Max 2 tokens held at a time. This single feature is the #1 churn reducer in habit apps: most users quit after their first miss, not because they stopped caring, but because starting over feels pointless.

HOW: Add `gate_passes: Int` to UserProfile. Award on $\text{streak} \% 10 == 0$. Deduct on `verifyStreakAndPenalties()` when a miss is detected.

Easy

Impact: High

G5 Skill Tree (Fitness / Focus / Mindset Branches)

Replace the flat level system with a branching skill tree. XP from Fitness quests feeds the Fitness branch, Focus quests feed the Focus branch, etc. Each branch has 5 tiers that unlock visual badges, new quest types, and bonus XP multipliers. Gives users a reason to balance their quest categories rather than stacking only the highest-XP quests.

HOW: Track XP per QuestCategory separately. Build a skill tree Compose screen with branch nodes. Persist per-branch XP in DataStore.

Hard

Impact: High

G6 Mini Streak Recovery Ritual

After a missed day, instead of a flat reset, show a 'Return of the Hunter' screen: complete 1 special comeback quest within 2 hours of opening the app to restore 50% of the streak. This turns a rage-quit moment into a redemption arc — fully on-brand with Solo Leveling's comeback narrative. Dramatically reduces uninstalls after the first miss.

HOW: Set comeback_available flag on miss detection. Show comeback quest on next launch within 2hr window. Clear on day completion.

Easy

Impact: High

G7 Daily Login Bonus (Soldier's Ration)

Award 10–25 XP just for opening the app each day, branded as 'Soldier's Ration'. Separate from quest completion. Shows a small animated coin drop on first daily open. Lowers the activation energy for habitual daily use — even on bad days, users open the app for the free XP, which makes quest completion more likely.

HOW: Check last_login_date on launch. If different from today, award bonus XP and show coin animation. Store in DataStore.

Easy

Impact: Medium

G8 Achievement Badge Collection (Separate from Cards)

A dedicated achievement system for milestone feats: '7-Day Streak', 'S-Class Achieved', '100 Quests Completed', 'Survived Hard Mode for 30 Days', 'Early Riser (5 AM wake for 14 days)'. Badges are rare, permanent, and displayed on the Profile screen. Gives completionists a long-term collection goal beyond the 90-day arc.

HOW: Define AchievementDef list in AppData. Check conditions after key events (streak update, quest complete, level up). Persist unlocked IDs in DataStore.

Medium

Impact: Medium

[UX]

U1 Weekly Dungeon Recap Screen

Every Sunday, auto-generate an animated weekly recap: XP earned, quests completed, streak held, rank progress, mood trend. Styled like a dungeon clear report card from the manhwa. Include a 'Share' button that exports it as a PNG image. Doubles as organic social marketing when users post it — zero ad spend needed.

HOW: Trigger on Sunday launch. Compute weekly stats from completedDates + moodEntries. Use Canvas API to render shareable bitmap.

Medium

Impact: High

U2 Onboarding Difficulty Calibration

Add a Step 3.5 between Goal and Wake Time: 'How disciplined are you right now?' — Beginner / Intermediate / Veteran. Beginners get 4 starter quests with lower XP targets. Veterans get 6 quests including Legendary-tier defaults. Reduces early frustration for new users and boredom for experienced ones.

HOW: Add discipline_level to onboarding state. Conditionally load different default quest subsets from AppData based on selection.

Easy

Impact: Medium

U3 Quest Marketplace / Protocol Packs

Pre-built 90-day quest protocol packs: 'Gym Rat Protocol', 'Tech Monk Mode', 'Academic Grind Season', 'Sleep God Route', 'Zero to Runner'. Each pack has 6 themed quests with custom XP weights. Users pick a protocol during onboarding or can switch from Profile. Massively improves out-of-box personalization without users needing to build from scratch.

HOW: Define QuestPack data class with list of Quests. Add pack selector screen. Load selected pack on completeOnboarding().

Medium

Impact: High

U4 NPC Mentor Character — 'The System'

Add a recurring 'System' NPC voice — occasional contextual messages in the Solo Leveling UI style: '[SYSTEM]: Hunter, your streak is at risk. Report to the gate.' Appears on home screen after 2 missed quests, on level-up, and after 30-day milestone. Feels deeply lore-accurate and adds personality without needing a full AI backend.

HOW: Define a list of trigger conditions + message strings in AppData. Show as animated overlay card on matching state.

Medium

Impact: Medium

U5 Offline Progress Backup (JSON Export/Import)

Add Export Progress and Import Progress buttons in Profile > App Info. Exports full DataStore state as a JSON file to device Downloads. On reinstall, user taps Import and restores everything. This is the #1 rage-uninstall trigger for habit apps — losing 60 days of data after a phone reset or app reinstall. Costs 2 hours to implement, saves your reviews.

HOW: Serialize full DataStore to JSON. Use Android Storage Access Framework (SAF) for file pick/save. No permissions needed on Android 10+.

Easy

Impact: High

U6 Seasonal 30-Day Mini Challenges

Parallel to the 90-day arc, offer opt-in 30-day themed sprints: '30-Day No Junk Food Challenge', '30-Day Morning Run Streak', '30-Day Digital Detox'. These have their own progress bar, dedicated XP pool, and a special completion badge. Great for users who've already finished the 90-day run and need a new loop.

HOW: Add Challenge model with separate progress tracking. Store in DataStore alongside main arc. Surface in Quests tab as a collapsible section.

Medium

Impact: Medium

[SOCIAL]

S1 Accountability Share Card (WhatsApp / Instagram)

Home screen button: 'Share Today's Progress'. Auto-generates a styled card: 'Day 34 of 90 | Streak: 12 ■ | XP: 4,200 | S-Class in training — @username'. Dark premium design matching the app aesthetic. Share directly to WhatsApp, Instagram Stories, or any app. Zero backend needed — pure local image generation. Drives organic installs.

HOW: Use Android Bitmap + Canvas to draw the share card. Share via Intent.ACTION_SEND with image/png MIME type.

Easy

Impact: High

S2 Challenge Code — Bring a Friend

Generate a unique 6-character challenge code from the Profile screen. Friend installs app, enters code in onboarding, and both users are linked locally via QR or manual code. Both see each other's day number and streak (no server needed — encode progress in a deep link URL). Creates social accountability without requiring backend infrastructure.

HOW: Encode UserProfile stats in a short Base64 URL. Use Android deep links for invite flow. Show linked partner's stats as a card on Home.

Hard

Impact: High

S3 Completion Certificate (Day 90)

On Day 90 completion, generate a full-screen cinematic 'S-Class Hunter Certification' card: name, final rank, total XP, best streak, completion date — styled like an official Solo Leveling guild card. Shareable as a high-res image. Makes the 90-day completion feel like a real achievement worth posting, not just a reset prompt.

HOW: Trigger on `dayNumber == 90` + all quests done. Render certificate bitmap using Canvas. Present on Home screen with confetti animation.

Easy

Impact: Medium

[TOOLS]

T1 Mood x Performance Correlation Insights

After 7+ days of mood journal data, surface a weekly insight card: 'Your XP is 40% higher on days you rate mood 4 or above.' Or: 'You complete more quests when you journal in the morning.' Turns the mood journal from a passive log into an active feedback loop. Gives users a data-backed reason to keep journaling.

HOW: Correlate `completedDates` XP totals with `moodEntry` scores in `AppRepository`. Generate insight string. Show in Home screen as weekly card.

Medium

Impact: Medium

T2 Focus Timer Ambient Sounds

Optional ambient audio during Focus Timer sessions: Lo-fi beats, Rain + Thunder, Dungeon Ambience (dark RPG atmospheric sounds), White Noise. Free tier gets one track (Lo-fi). Premium gets full library. Bundled audio files keep it 100% offline. High perceived value for minimal effort — audio is the #1 most-requested feature in Pomodoro apps.

HOW: Bundle 4 short looping audio files (~2 MB each). Use Android `MediaPlayer` with looping. Add sound picker to `FocusTimerScreen` settings.

Medium

Impact: Medium

T3 Health Connect Integration (Steps / Sleep)

Integrate with Android Health Connect API to auto-fill quest completion: if step count > 3,000, auto-check 'Morning Walk'. If sleep end time < 11 PM, auto-check 'Sleep Before 11PM'. User grants permission once; the app reads health data on launch. Removes manual logging friction — the biggest barrier to daily habit tracking.

HOW: Add Health Connect dependency. Request `READ_STEPS` + `READ_SLEEP_SESSION` permissions. Call `HealthConnectClient` in `AppRepository` on launch to auto-complete eligible quests.

Hard

Impact: High

T4 Expanded Food Database + Barcode Scanner

Expand calorie tracker from 40 to 200+ Indian foods (idli, dosa, sambar, dal, chapati, biryani etc.) — highly relevant for the Indian user base. Add a barcode scanner using CameraX + ML Kit to scan packaged food. Falls back to manual search if barcode not found. Turns the calorie tracker from a demo into an actually useful daily tool.

HOW: Expand FoodDatabase.kt to 200 items. Add CameraX + ML Kit Barcode Scanning dependency. Parse nutrition from Open Food Facts API (free, offline cache).

Hard

Impact: Medium

[MONETIZATION]

M1 Google Play Billing Integration

Replace the simulated subscription toggle with real Google Play Billing. Recommended pricing for Indian market: Monthly at Rs 99, Quarterly at Rs 249, Lifetime at Rs 499. Lifetime typically converts 2-3x better than subscription for discipline apps because users feel ownership, not recurring commitment. Use BillingClient v6 with PurchaseHistoryResponseListener for restore purchases.

HOW: Add com.android.billingclient:billing-ktx. Implement BillingClientWrapper. Verify purchases server-side or use Play's offline verification for v1.

Hard

Impact: High

M2 XP Boost Pack (Consumable IAP)

Offer consumable in-app purchases: '2x XP Weekend' (Rs 29), 'Streak Shield 3-pack' (Rs 49). These are impulse buys that don't break free-tier fairness — they accelerate, not gate. Position as 'Hunter's Supply Cache' to keep the lore consistent. Works well alongside subscription — different price sensitivity tiers.

HOW: Add consumable SKUs to Play Console. Handle CONSUMABLE purchase type in BillingClient. Apply XP multiplier via awardXP() modifier flag.

Medium

Impact: Medium

M3 Referral Reward Loop

When a user shares their challenge code and a friend completes Day 3, the original user gets 7 days of Premium free and a 'Guild Leader' badge. No backend needed — use local install referrer API + deep link tracking. Referral loops in habit apps have shown 25-40% install lift in similar categories. Costs nothing per conversion — premium access is just a flag flip.

HOW: Use Play Install Referrer Library to detect referred installs. Award referrer premium_days in DataStore. Show reward animation on qualifying event.

Medium

Impact: High

[TECH]

X1 Streak Warning Push Notification

Schedule a local push notification at 9 PM every day: 'Hunter, the gate closes in 3 hours. Your streak is at risk.' Cancel the notification automatically when all quests are completed. This is the single highest-ROI feature missing from v1 — every major habit app study shows evening reminders reduce churn by 30-50% in the first 30 days.

HOW: Use WorkManager with PeriodicWorkRequest (daily at 21:00). Cancel work via WorkManager.cancelAllWorkByTag() on day completion. No internet permission needed.

Easy

Impact: High

X2 Android Home Screen Widget

A 2x1 home screen widget showing: Day X of 90, current streak with fire icon, and today's quest completion count (e.g., '3/6 done'). Updates every 30 minutes via AppWidgetProvider. Users see it every time they unlock their phone — passive retention without requiring the app to be opened. Estimated to reduce 30-day churn by 15-20% based on comparable apps.

HOW: Create AppWidgetProvider subclass. Build RemoteViews layout. Register in AndroidManifest. Read DataStore in onUpdate() via runBlocking (widget context limitation).

Hard

Impact: High

X3 Crash Reporting + Analytics (Privacy-First)

Integrate Firebase Crashlytics (free) for crash reporting — essential for identifying ANRs and crashes that your test device doesn't hit. Add minimal anonymous analytics: quest_completed, day_advanced, streak_broken events only. No personal data collected. Add a privacy disclosure in onboarding: 'Anonymous crash reports help improve the app.' You're flying blind without this in production.

HOW: Add Firebase BOM + Crashlytics + Analytics dependencies. Initialize in MainActivity. Log 3-5 key events only. Add opt-out toggle in Profile for GDPR compliance.

Easy

Impact: Medium

X4 Dark / AMOLED Theme Toggle

Add a true AMOLED black mode (pure #000000 backgrounds) alongside the current #0B0F1A dark theme. On OLED phones (most mid-range and flagship Android devices), pure black pixels are literally turned off — real battery savings and improved contrast. Add toggle in Profile > Appearance. Small effort, appreciated by power users.

HOW: Add amoled_mode Boolean to DataStore. Pass background color token to MaterialTheme. Toggle between #0B0F1A and #000000 for DarkBg.

Easy

Impact: Low

[PRIORITY MATRIX]

Sort your roadmap by effort vs impact. Start with Easy + High Impact — these are free wins.

ID	Feature	Cat	Effort	Impact
G1	Rank System — E Class to S Class	Gamification	Easy	High
G4	Forgiveness Token — Gate Pass System	Gamification	Easy	High
